

Amendments to the Abstract

Please **add** the following Abstract to this application.

-- To assist an operator to position a wireless camera (~~CSF~~) so that a base station (~~SB~~) receives with good quality a radiofrequency signal (~~S~~) transmitted from a transmitter (~~EC~~) linked to the camera, several measurers (~~M1-MK~~) linked to diversity receivers (~~R1-RK~~) of the signal each determine whether a characteristic of the signal via the respective receiver satisfies a reception criterion (~~TH~~). In the base station, a counter (~~COM~~) counts the receivers satisfying the reception criterion, and a divider (~~DIV~~) establishes a reception quality indicator (~~QR~~) dependent on the number of satisfactory receivers so as in particular to retransmit it via a return channel (~~VR~~) to the camera so that it can be displayed thereon.--
